ABOUT ME

SHORT BIO

I received the Bachelor's and Master's degrees in Computer Engineering and the PhD in Computer Science and Engineering from the University of Bologna (Italy) in 2014, 2017, and 2021, respectively. I am covering the role of Associate Professor at the Department of Environmental Sciences, Informatics and Statistics (DAIS) of the Ca' Foscari University of Venice.

RESEARCH TOPICS

My research areas are **Computer Vision** and **Artificial Intelligence**.

Visual Perception | Multimodal Perception | 3D Reconstruction | 3D Data Analysis | Anomaly Detection | Neural Implicit Representations

01 Neural Networks for Computer Vision

Inferring scene properties from data captured by sensors, such as cameras and 3D sensors, is essential for many practical applications, including autonomous driving, medical imaging, robot navigation, and others. My research focuses on addressing this goal by employing deep neural networks. During these years, I have developed novel techniques for various tasks, including semantic segmentation, depth estimation, optical flow, camera calibration, registration, anomaly detection, and 3D computer vision. Examples of publications in this field include top conference papers such as [P5], [P10], [P11], [P17], [P19], [P23], as well as top journal articles such as [J1], [J3], [J4], and [J5].

02 Weakly Supervised Learning

Machine learning and deep learning approaches require a large number of training data points with annotations to perform accurately in unseen environments. However, collecting such annotations is a time-consuming and tedious task. In my research, I developed several techniques to address this problem, ranging from transfer learning, unsupervised domain adaptation, self-supervised techniques, and representation learning approaches. Examples of publications in top venues in this field are [P3], [J2], and [J3].

03 Neural Networks as New Data Modality

The ongoing deep learning revolution of the last decade has led to the training of hundreds of millions of neural networks (NNs) on diverse datasets. At the same time, the recent rise of foundation models has led to a rapid increase in the number of publicly available neural network models. On Hugging Face alone, there are over a million models, with thousands more added daily. As a result, they can be considered a new independent modality, and the ample knowledge contained in the parameters, the abstraction learned via training, as well as the behaviors of the trained models themselves, are stored in the architectures and parameters of the trained NNs. My research focuses on extracting information by processing neural functions, particularly in analyzing neural fields — networks that represent individual instances of continuous signals, such as images, videos, 3D scenes, and audio. Examples of publications in top venues in this field are [P14], [P18], [P25], and [J6].
